

GUYMASTER Release Note
For version 7.5.2 as of August, 2023

1. Change in how appurtenances are treated by GUYMASTER in the inclusion zone and which appurtenances are considered:
 - a. An appurtenance is considered inside the inclusion zone only when the entire appurtenance is located inside the inclusion zone.
 - b. Appurtenances defined by their effective projected areas, EPA, using the DISCRETE PROJECTED AREAS table will not be considered to be within the inclusion zone even if they happen to be within it. The user will have been assumed to have included a Ka factor in determining the EPA that he enters for the appurtenance unless specified in the Ka column inside the Discrete Appetences table.
